

Amendments to the Specification

Please amend paragraph 2 on page 8 as follows:

Figure 6 illustrates hose holder 10 mounted on a vertical wall 28 and holding hose 52. The two hose support members 12 are mounted at the same level on vertical wall ~~28~~ 48 with the ribs 32 of each support member facing the other support member. Panels 20 rest flush on wall 48 and are secured to the wall by suitable fasteners 50 extending through holes 40. As illustrated, the arm panels 22 support the panels 18 against outward deflection caused by hose 52 being mounted between the two hose support members 12.

Please amend paragraph 4 on page 9 as follows:

The hose support members 12 and 72 each have two spaced hose retention ribs ~~36~~ 32. The members may have single hose retention ribs as desired. A two-rib holder has the advantage that a mounting hole may be provided in the center of the support panel 18 and each member may be molded from a single mold. If a member were molded with a single side rib and a central mounting hole and the same member were mounted on both sides of the holder, the two ribs would be located at different levels, which would be aesthetically undesirable although functionally viable.

Please amend paragraph 3 on page 10 as follows:

The support members 102 are mounted on opposing sides of handle 90 so that the ribs ~~102~~ 106 face each other. Handle 90 is received in sockets 110 and held by suitable fasteners 116 through the holes 114.
